

# Chapter 7: Redox Reactions

## Comprehensive Study Notes

### Class 11 Chemistry - NCERT Based

### EXAM SPRINT - Complete Coverage for NEET and JEE Examinations

## Introduction

Redox reactions represent one of the most important categories of chemical transformations. These reactions are fundamental to numerous processes including:

### Everyday Applications:

- Combustion of fuels for energy
- Battery operations (dry and wet cells)
- Metal corrosion processes
- Industrial manufacturing (caustic soda production)

### Advanced Applications:

- Electrochemical metal extraction
- Pharmaceutical synthesis
- Environmental processes (Hydrogen Economy, Ozone depletion)
- Biological systems (respiration, photosynthesis)

**Key Principle:** In redox reactions, oxidation and reduction occur simultaneously - "Where there is oxidation, there is always reduction."

---

## 7.1 CLASSICAL IDEA OF REDOX REACTIONS

### Historical Evolution of Oxidation Concept

#### Stage 1: Oxygen-Based Definition

**Original Definition:** Oxidation = Addition of oxygen to an element/compound

#### Examples:

- $2\text{Mg(s)} + \text{O}_2\text{(g)} \rightarrow 2\text{MgO(s)}$  (*Mg oxidized*)
- $\text{S(s)} + \text{O}_2\text{(g)} \rightarrow \text{SO}_2\text{(g)}$  (*S oxidized*)
- $\text{CH}_4\text{(g)} + 2\text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)} + 2\text{H}_2\text{O(l)}$  (*CH<sub>4</sub> oxidized*)

#### Stage 2: Hydrogen-Based Extension

**Expanded Definition:** Oxidation = Removal of hydrogen from a compound

#### Example:

- $2\text{H}_2\text{S(g)} + \text{O}_2\text{(g)} \rightarrow 2\text{S(s)} + 2\text{H}_2\text{O(l)}$  (*H<sub>2</sub>S oxidized by H removal*)

#### Stage 3: Electronegativity-Based Generalization

#### Modern Classical Definition:

- **Oxidation:** Addition of electronegative element OR removal of electropositive element
- **Reduction:** Addition of electropositive element OR removal of electronegative element

#### Examples:

- $\text{Mg(s)} + \text{F}_2\text{(g)} \rightarrow \text{MgF}_2\text{(s)}$  (*Mg oxidized - F added*)
- $\text{Mg(s)} + \text{Cl}_2\text{(g)} \rightarrow \text{MgCl}_2\text{(s)}$  (*Mg oxidized - Cl added*)
- $2\text{K}_4[\text{Fe(CN)}_6] + \text{H}_2\text{O}_2 \rightarrow 2\text{K}_3[\text{Fe(CN)}_6] + 2\text{KOH}$  (*K removal = oxidation*)

## Classical Reduction Examples

- $2\text{HgO}(s) \rightarrow 2\text{Hg}(l) + \text{O}_2(g)$  (*O removal*)
- $2\text{FeCl}_3(aq) + \text{H}_2(g) \rightarrow 2\text{FeCl}_2(aq) + 2\text{HCl}(aq)$  (*Cl removal*)
- $\text{CH}_2=\text{CH}_2(g) + \text{H}_2(g) \rightarrow \text{H}_3\text{C}-\text{CH}_3(g)$  (*H addition*)

**Key Insight:** Oxidation and reduction always occur simultaneously, leading to the term "redox."

---

## 7.2 REDOX REACTIONS IN TERMS OF ELECTRON TRANSFER

### Electronic Theory Foundation

#### Modern Definition:

- **Oxidation:** Loss of electrons by a species
- **Reduction:** Gain of electrons by a species
- **Oxidizing agent (Oxidant):** Electron acceptor
- **Reducing agent (Reductant):** Electron donor

### Half-Reaction Approach

#### Example: Formation of NaCl

- **Overall:**  $2\text{Na}(s) + \text{Cl}_2(g) \rightarrow 2\text{NaCl}(s)$
- **Oxidation half:**  $2\text{Na}(s) \rightarrow 2\text{Na}^+(g) + 2e^-$
- **Reduction half:**  $\text{Cl}_2(g) + 2e^- \rightarrow 2\text{Cl}^-(g)$

### 7.2.1 Competitive Electron Transfer Reactions

#### Metal Activity Series

### Experimental Observations:

1.  $\text{Zn} + \text{Cu}^{2+} \rightarrow \text{Zn}^{2+} + \text{Cu}$  (Spontaneous)
2.  $\text{Cu} + \text{Zn}^{2+} \rightarrow \text{No reaction}$  (Non-spontaneous)

**Activity Order:**  $\text{Zn} > \text{Cu} > \text{Ag}$  (decreasing electron-releasing tendency)

### Galvanic Cell Formation:

- Chemical energy  $\rightarrow$  Electrical energy
  - Basis for electrochemical series
  - Foundation for battery technology
- 

## 7.3 OXIDATION NUMBER

### Definition and Purpose

**Oxidation Number:** A hypothetical charge assigned to an atom in a compound, assuming complete electron transfer to the more electronegative atom.

### Purpose:

- Track electron movement in covalent compounds
- Systematic approach to identify redox changes
- Balancing complex redox equations

### Rules for Assigning Oxidation Numbers

#### Fundamental Rules:

1. **Free elements:** Oxidation number = 0
  - Examples:  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{Cl}_2$ ,  $\text{P}_4$ ,  $\text{S}_8$ , Na, Mg

2. **Monatomic ions:** Oxidation number = Ionic charge

- $\text{Na}^+ = +1$ ,  $\text{Mg}^{2+} = +2$ ,  $\text{Cl}^- = -1$ ,  $\text{O}^{2-} = -2$

3. **Group trends:**

- **Group 1:** Always +1 in compounds
- **Group 2:** Always +2 in compounds
- **Aluminum:** Always +3 in compounds

4. **Oxygen rules:**

- **Most compounds:** -2
- **Peroxides ( $\text{H}_2\text{O}_2$ ,  $\text{Na}_2\text{O}_2$ ):** -1
- **Superoxides ( $\text{KO}_2$ ,  $\text{RbO}_2$ ):**  $-1/2$
- **With fluorine ( $\text{OF}_2$ ,  $\text{O}_2\text{F}_2$ ):** +2, +1 respectively

5. **Hydrogen rules:**

- **Most compounds:** +1
- **Metal hydrides ( $\text{LiH}$ ,  $\text{NaH}$ ,  $\text{CaH}_2$ ):** -1

6. **Halogen rules:**

- **Fluorine:** Always -1
- **Other halogens:** Usually -1, positive in oxoacids/oxoanions

7. **Electroneutrality:**

- **Neutral compounds:** Sum of oxidation numbers = 0
- **Polyatomic ions:** Sum = Ionic charge

## Oxidation Number Applications

### Identifying Redox Changes:

- **Oxidation:** Increase in oxidation number

- **Reduction:** Decrease in oxidation number
- **Oxidizing agent:** Species undergoing reduction
- **Reducing agent:** Species undergoing oxidation

### Stock Notation:

Roman numerals in parentheses indicate oxidation states:

- $\text{AuCl} \rightarrow \text{Au(I)Cl}$
  - $\text{AuCl}_3 \rightarrow \text{Au(III)Cl}_3$
  - $\text{SnCl}_2 \rightarrow \text{Sn(II)Cl}_2$
  - $\text{SnCl}_4 \rightarrow \text{Sn(IV)Cl}_4$
- 

## 7.3.1 TYPES OF REDOX REACTIONS

### 1. Combination Reactions

**Pattern:**  $A + B \rightarrow C$  (where A or B or both are elements)

**Examples:**

- $\text{C(s)} + \text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)}$  (C:  $0 \rightarrow +4$ )
- $3\text{Mg(s)} + \text{N}_2\text{(g)} \rightarrow \text{Mg}_3\text{N}_2\text{(s)}$  (Mg:  $0 \rightarrow +2$ , N:  $0 \rightarrow -3$ )
- $\text{CH}_4\text{(g)} + 2\text{O}_2\text{(g)} \rightarrow \text{CO}_2\text{(g)} + 2\text{H}_2\text{O(l)}$  (C:  $-4 \rightarrow +4$ )

### 2. Decomposition Reactions

**Pattern:** Compound  $\rightarrow$  Elements + Other compounds

**Examples:**

- $2\text{H}_2\text{O}(\text{l}) \rightarrow 2\text{H}_2(\text{g}) + \text{O}_2(\text{g})$  ( $\text{H}: +1 \rightarrow 0$ ,  $\text{O}: -2 \rightarrow 0$ )
- $2\text{NaH}(\text{s}) \rightarrow 2\text{Na}(\text{s}) + \text{H}_2(\text{g})$  ( $\text{Na}: +1 \rightarrow 0$ ,  $\text{H}: -1 \rightarrow 0$ )
- $2\text{KClO}_3(\text{s}) \rightarrow 2\text{KCl}(\text{s}) + 3\text{O}_2(\text{g})$  ( $\text{Cl}: +5 \rightarrow -1$ ,  $\text{O}: -2 \rightarrow 0$ )

**Note:** Not all decomposition reactions are redox reactions.

- $\text{CaCO}_3(\text{s}) \rightarrow \text{CaO}(\text{s}) + \text{CO}_2(\text{g})$  (*Not redox - no oxidation state changes*)

### 3. Displacement Reactions

#### Metal Displacement:

**Pattern:** More active metal displaces less active metal from compound

#### Examples:

- $\text{CuSO}_4(\text{aq}) + \text{Zn}(\text{s}) \rightarrow \text{Cu}(\text{s}) + \text{ZnSO}_4(\text{aq})$
- $\text{V}_2\text{O}_5(\text{s}) + 5\text{Ca}(\text{s}) \rightarrow 2\text{V}(\text{s}) + 5\text{CaO}(\text{s})$
- $\text{TiCl}_4(\text{l}) + 2\text{Mg}(\text{s}) \rightarrow \text{Ti}(\text{s}) + 2\text{MgCl}_2(\text{s})$

#### Hydrogen Displacement:

##### From water:

- $2\text{Na}(\text{s}) + 2\text{H}_2\text{O}(\text{l}) \rightarrow 2\text{NaOH}(\text{aq}) + \text{H}_2(\text{g})$
- $\text{Ca}(\text{s}) + 2\text{H}_2\text{O}(\text{l}) \rightarrow \text{Ca}(\text{OH})_2(\text{aq}) + \text{H}_2(\text{g})$

##### From steam:

- $\text{Mg}(\text{s}) + 2\text{H}_2\text{O}(\text{g}) \rightarrow \text{Mg}(\text{OH})_2(\text{s}) + \text{H}_2(\text{g})$
- $2\text{Fe}(\text{s}) + 3\text{H}_2\text{O}(\text{g}) \rightarrow \text{Fe}_2\text{O}_3(\text{s}) + 3\text{H}_2(\text{g})$

##### From acids:

- $\text{Zn(s)} + 2\text{HCl(aq)} \rightarrow \text{ZnCl}_2\text{(aq)} + \text{H}_2\text{(g)}$
- $\text{Fe(s)} + 2\text{HCl(aq)} \rightarrow \text{FeCl}_2\text{(aq)} + \text{H}_2\text{(g)}$

**Non-metal Displacement:**

**Halogen activity series:**  $\text{F}_2 > \text{Cl}_2 > \text{Br}_2 > \text{I}_2$

**Examples:**

- $\text{Cl}_2\text{(g)} + 2\text{KBr(aq)} \rightarrow 2\text{KCl(aq)} + \text{Br}_2\text{(l)}$
- $\text{Cl}_2\text{(g)} + 2\text{KI(aq)} \rightarrow 2\text{KCl(aq)} + \text{I}_2\text{(s)}$
- $\text{Br}_2\text{(l)} + 2\text{I}^-\text{(aq)} \rightarrow 2\text{Br}^-\text{(aq)} + \text{I}_2\text{(s)}$

**Industrial Application:** Layer Test for halide identification

#### 4. Disproportionation Reactions

**Definition:** Same element simultaneously oxidized and reduced

**Requirements:**

- Element in intermediate oxidation state
- Can exist in at least 3 different oxidation states
- Products have higher and lower oxidation states

**Examples:**

- $2\text{H}_2\text{O}_2\text{(aq)} \rightarrow 2\text{H}_2\text{O(l)} + \text{O}_2\text{(g)}$  (O:  $-1 \rightarrow -2, 0$ )
- $3\text{Cl}_2\text{(g)} + 6\text{OH}^-\text{(aq)} \rightarrow 5\text{Cl}^-\text{(aq)} + \text{ClO}_3^-\text{(aq)} + 3\text{H}_2\text{O(l)}$  (Cl:  $0 \rightarrow -1, +5$ )
- $\text{P}_4\text{(s)} + 3\text{OH}^-\text{(aq)} + 3\text{H}_2\text{O(l)} \rightarrow \text{PH}_3\text{(g)} + 3\text{H}_2\text{PO}_2^-\text{(aq)}$  (P:  $0 \rightarrow -3, +1$ )

**Exception:** Fluorine cannot disproportionate (most electronegative, no positive oxidation state)

---

## 7.3.2 BALANCING REDOX REACTIONS

### Method 1: Oxidation Number Method

#### Steps:

1. **Write correct formulas** for all reactants and products
2. **Assign oxidation numbers** to identify changing elements
3. **Calculate electron change** and equalize gain/loss
4. **Balance ionic charges** (add  $\text{H}^+$  in acidic,  $\text{OH}^-$  in basic medium)
5. **Balance atoms** by adding  $\text{H}_2\text{O}$  molecules
6. **Verify balance** (atoms and charges)

**Example:**  $\text{Cr}_2\text{O}_7^{2-} + \text{SO}_3^{2-} \rightarrow \text{Cr}^{3+} + \text{SO}_4^{2-}$  (acidic)

#### Step-by-step:

1.  $\text{Cr}_2\text{O}_7^{2-}(\text{aq}) + \text{SO}_3^{2-}(\text{aq}) \rightarrow \text{Cr}^{3+}(\text{aq}) + \text{SO}_4^{2-}(\text{aq})$
2. Cr:  $+6 \rightarrow +3$  (decrease of 3,  $\times 2 = 6e^-$  gained) S:  $+4 \rightarrow +6$  (increase of 2,  $\times 3 = 6e^-$  lost)
3.  $\text{Cr}_2\text{O}_7^{2-} + 3\text{SO}_3^{2-} \rightarrow 2\text{Cr}^{3+} + 3\text{SO}_4^{2-}$
4. Add  $8\text{H}^+$ :  $\text{Cr}_2\text{O}_7^{2-} + 3\text{SO}_3^{2-} + 8\text{H}^+ \rightarrow 2\text{Cr}^{3+} + 3\text{SO}_4^{2-}$
5. Add  $4\text{H}_2\text{O}$ :  $\text{Cr}_2\text{O}_7^{2-} + 3\text{SO}_3^{2-} + 8\text{H}^+ \rightarrow 2\text{Cr}^{3+} + 3\text{SO}_4^{2-} + 4\text{H}_2\text{O}$

### Method 2: Half-Reaction Method

#### Steps:

1. **Write unbalanced ionic equation**
2. **Separate into half-reactions**

3. **Balance atoms** (other than O and H)
4. **Add H<sub>2</sub>O** to balance O atoms
5. **Add H<sup>+</sup>** to balance H atoms (acidic medium)
6. **Add electrons** to balance charges
7. **Equalize electrons** in both half-reactions
8. **Add half-reactions** and simplify
9. **For basic medium:** Add OH<sup>-</sup> to neutralize H<sup>+</sup>

**Example: MnO<sub>4</sub><sup>-</sup> + I<sup>-</sup> → MnO<sub>2</sub> + I<sub>2</sub> (basic)**

**Oxidation half:** 2I<sup>-</sup> → I<sub>2</sub> + 2e<sup>-</sup> **Reduction half:** MnO<sub>4</sub><sup>-</sup> + 4H<sup>+</sup> + 3e<sup>-</sup> → MnO<sub>2</sub> + 2H<sub>2</sub>O

**For basic medium:** Add 4OH<sup>-</sup> to both sides of reduction half: MnO<sub>4</sub><sup>-</sup> + 4H<sub>2</sub>O + 3e<sup>-</sup> → MnO<sub>2</sub> + 4OH<sup>-</sup>

**Balanced equation:** 6I<sup>-</sup> + 2MnO<sub>4</sub><sup>-</sup> + 4H<sub>2</sub>O → 3I<sub>2</sub> + 2MnO<sub>2</sub> + 8OH<sup>-</sup>

---

### 7.3.3 REDOX TITRATIONS

#### Self-Indicator Systems

**Example: Permanganate Titrations**

- MnO<sub>4</sub><sup>-</sup> (purple) → Mn<sup>2+</sup> (colorless)
- End point: First permanent pink color
- Sensitivity: 10<sup>-6</sup> mol/L detection limit

#### External Indicator Systems

**Example: Dichromate Titrations**

- Uses diphenylamine indicator
- Color change: Colorless → Intense blue
- Indicates complete oxidation of analyte

### Iodometric Methods

**Principle:** Indirect determination using  $I_2/I^-$  couple

#### Steps:

1. **Liberation:**  $Cu^{2+} + 4I^- \rightarrow Cu_2I_2 + I_2$
  2. **Detection:**  $I_2 + \text{starch} \rightarrow \text{Blue complex}$
  3. **Titration:**  $I_2 + 2S_2O_3^{2-} \rightarrow 2I^- + S_4O_6^{2-}$
  4. **End point:** Blue color disappears
- 

## 7.4 REDOX REACTIONS AND ELECTRODE PROCESSES

### Electrochemical Cells

#### Redox Couples

**Definition:** Oxidized and reduced forms of same species **Notation:** Oxidized form/Reduced form

**Examples:**  $Cu^{2+}/Cu$ ,  $Zn^{2+}/Zn$ ,  $Fe^{3+}/Fe^{2+}$

#### Daniell Cell

##### Construction:

- **Anode:**  $Zn|Zn^{2+}$  (oxidation occurs)
- **Cathode:**  $Cu^{2+}|Cu$  (reduction occurs)
- **Salt bridge:** Maintains electrical neutrality

- **External circuit:** Electron flow (Zn → Cu)

### Cell Reactions:

- **Anode:**  $\text{Zn(s)} \rightarrow \text{Zn}^{2+}(\text{aq}) + 2\text{e}^{-}$
- **Cathode:**  $\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu(s)}$
- **Overall:**  $\text{Zn(s)} + \text{Cu}^{2+}(\text{aq}) \rightarrow \text{Zn}^{2+}(\text{aq}) + \text{Cu(s)}$

### Standard Electrode Potentials

#### Definition and Convention

- **Standard conditions:** 298K, 1 atm, 1M concentration
- **Reference:** Standard Hydrogen Electrode (SHE) = 0.00 V
- **Sign convention:**
  - Negative  $E^{\circ}$  = Stronger reducing agent than  $\text{H}^{+}/\text{H}_2$
  - Positive  $E^{\circ}$  = Weaker reducing agent than  $\text{H}^{+}/\text{H}_2$

#### Electrochemical Series (Selected Values)

Half-Reaction	E° (V)
$\text{Li}^+ + \text{e}^- \rightarrow \text{Li}$	-3.05
$\text{K}^+ + \text{e}^- \rightarrow \text{K}$	-2.93
$\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$	-2.71
$\text{Mg}^{2+} + 2\text{e}^- \rightarrow \text{Mg}$	-2.36
$\text{Al}^{3+} + 3\text{e}^- \rightarrow \text{Al}$	-1.66
$\text{Zn}^{2+} + 2\text{e}^- \rightarrow \text{Zn}$	-0.76
$\text{Fe}^{2+} + 2\text{e}^- \rightarrow \text{Fe}$	-0.44
$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	0.00
$\text{Cu}^{2+} + 2\text{e}^- \rightarrow \text{Cu}$	+0.34
$\text{I}_2 + 2\text{e}^- \rightarrow 2\text{I}^-$	+0.54
$\text{Ag}^+ + \text{e}^- \rightarrow \text{Ag}$	+0.80
$\text{Br}_2 + 2\text{e}^- \rightarrow 2\text{Br}^-$	+1.09
$\text{Cl}_2 + 2\text{e}^- \rightarrow 2\text{Cl}^-$	+1.36
$\text{MnO}_4^- + 8\text{H}^+ + 5\text{e}^- \rightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O}$	+1.51
$\text{F}_2 + 2\text{e}^- \rightarrow 2\text{F}^-$	+2.87

### Applications:

- Predicting spontaneous reactions
  - Designing galvanic cells
  - Understanding corrosion
  - Metal extraction processes
-

# NEET/JEE Important Points

## High-Yield Topics:

### 1. Oxidation Number Rules:

- Exception cases (peroxides, superoxides, metal hydrides)
- Stock notation for transition metals
- Fractional oxidation numbers (average states)

### 2. Balancing Equations:

- Both algebraic and half-reaction methods
- Acidic vs basic medium differences
- Common redox couples

### 3. Types of Reactions:

- Identification from equations
- Disproportionation conditions
- Industrial applications

### 4. Electrochemical Series:

- Predicting reaction feasibility
- Metal displacement reactions
- Relative reducing/oxidizing power

## Common Exam Patterns:

### 1. Numerical Problems:

- Oxidation number calculations
- Equivalent weight determinations
- Titration calculations

## **2. Mechanism Questions:**

- Electron transfer pathways
- Half-reaction writing
- Cell representations

## **3. Application Problems:**

- Industrial processes
  - Biological systems
  - Environmental chemistry
- 

## **Memory Aids and Mnemonics**

### **Oxidation Number Rules:**

**"Free Elements Get Zero, Ions Get Their Charge"**

- Free elements = 0
- Monatomic ions = charge

### **Redox Definitions:**

**"OIL RIG LEO GER"**

- **O**xidation Is **L**oss (of electrons)

- Reduction Is **G**ain (of electrons)
- Loss of **E**lectrons **O**xidation
- **G**ain of **E**lectrons **R**eduction

### Electrochemical Series:

"Please Stop Calling Me A Careless Zebra Instead Try Learning How Copper Shows Bravery In Acidic Conditions For Gold"

- **P**b, **S**n, **C**d, **M**g, **A**l, **C**r, **Z**n, Iron, **T**in, **L**ead, **H**<sub>2</sub>, **C**u, **S**ilver, **B**romine, **I**odine, **A**u, **C**l<sub>2</sub>, **F**<sub>2</sub>, **G**old

### Balancing Steps:

"Write Assign Calculate Balance Verify"

- **W**rite skeleton equation
- **A**ssign oxidation numbers
- **C**alculate electron changes
- **B**alance charges and atoms
- **V**erify final equation

## Practice Questions for NEET/JEE

### Multiple Choice Questions:

1. In the reaction:  $2\text{FeCl}_3 + \text{H}_2\text{S} \rightarrow 2\text{FeCl}_2 + 2\text{HCl} + \text{S}$ , which species is oxidized? a)  $\text{Fe}^{3+}$  b)  $\text{Cl}^-$  c)  $\text{H}_2\text{S}$  d)  $\text{S}$
2. The oxidation number of Cr in  $\text{K}_2\text{Cr}_2\text{O}_7$  is: a) +3 b) +6 c) +7 d) +2
3. Which of the following is a disproportionation reaction? a)  $2\text{H}_2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{O}_2$  b)  $\text{Zn} + \text{CuSO}_4 \rightarrow \text{ZnSO}_4 + \text{Cu}$  c)  $2\text{KI} + \text{Cl}_2 \rightarrow 2\text{KCl} + \text{I}_2$  d)  $\text{CaCO}_3 \rightarrow \text{CaO} + \text{CO}_2$

### Assertion-Reason Questions:

**Assertion (A):** In the reaction  $\text{Cl}_2 + 2\text{KI} \rightarrow 2\text{KCl} + \text{I}_2$ ,  $\text{Cl}_2$  is reduced. **Reason (R):** The oxidation number of Cl decreases from 0 to -1.

### Short Answer Questions:

1. Balance the equation:  $\text{MnO}_4^- + \text{C}_2\text{O}_4^{2-} \rightarrow \text{Mn}^{2+} + \text{CO}_2$  (acidic medium)
2. Calculate the oxidation number of S in  $\text{Na}_2\text{S}_4\text{O}_6$ .
3. Identify the oxidizing and reducing agents in:  $\text{Cu} + 2\text{H}_2\text{SO}_4 \rightarrow \text{CuSO}_4 + \text{SO}_2 + 2\text{H}_2\text{O}$

### Long Answer Questions:

1. Explain the electronic concept of redox reactions with examples.
2. Derive the relationship between oxidation number change and electrons transferred.
3. Describe the construction and working of Daniell cell.

---

## Summary Table: Key Comparisons

### Classical vs Electronic Concepts:

Aspect	Classical	Electronic
<b>Oxidation</b>	Addition of $\text{O}_2$ /electronegative element	Loss of electrons
<b>Reduction</b>	Addition of $\text{H}_2$ /electropositive element	Gain of electrons
<b>Scope</b>	Limited to specific elements	Universal applicability
<b>Mechanism</b>	Atom/ion transfer	Electron transfer

## Balancing Methods Comparison:

Method	Best For	Limitations
Oxidation Number	Simple reactions, beginners	Complex polyatomic ions
Half-Reaction	Complex reactions, electrochemistry	Requires ion knowledge

## Types of Redox Reactions:

Type	Characteristics	Examples
Combination	$A + B \rightarrow C$	Metal + non-metal
Decomposition	$AB \rightarrow A + B$	Electrolysis reactions
Displacement	$A + BC \rightarrow AC + B$	Metal activity series
Disproportionation	Same element oxidized and reduced	$\text{ClO}^- \rightarrow \text{Cl}^- + \text{ClO}_3^-$

**EXAM SPRINT** - Master Redox Reactions through systematic study of electron transfer concepts, oxidation number rules, balancing techniques, and electrochemical applications. Regular practice of numerical problems and mechanism questions is essential for NEET/JEE success.
